

Human Digestive System

The human digestive system is responsible for breaking down food into nutrients that the body can absorb. It starts at the mouth, where mechanical digestion occurs via chewing and chemical digestion begins with enzymes in saliva. Food travels down the esophagus into the stomach, where strong acids and enzymes further break it down. The small intestine absorbs nutrients with the help of villi, while the large intestine absorbs water and forms feces. Accessory organs like the liver, pancreas, and gallblad...
